Be sure to read this article

The United States Centers for Disease Control and Prevention (CDC) did a study during August this year to determine the COVID-19 risk to unvaccinated people, and this is what they found:

The risk of dying from COVID-19 was **11 times higher** for unvaccinated adults than for fully vaccinated adults.

Unvaccinated adults had a **six times higher** risk of becoming infected by COVID-19 than vaccinated adult.

The risk of being hospitalised was nearly **19 times higher** for unvaccinated adults than fully vaccinated adults.

The rate of COVID-19 hospitalisation among adults under the age of 50 is **15 times higher** for unvaccinated people than for fully vaccinated people.

The rate of COVID-19 hospitalisation for adults aged 50 to 64 is **31 times higher** for unvaccinated people than for vaccinated people.
